## Remote seals with capillary tube

### 2600T Series Pressure Transmitters

Engineered solutions for all  
applications

#### Wide range of remote seal types

- Allows optimum design for each application without compromising performance

#### Large selection of options, materials and fill fluids

- Meets nearly all process requirements

#### Designed for use with the 2600T pressure transmitter

- Combines an economically feasible and technically sound solution that ensures total reliability from line pressure to full vacuum

#### Special designed remote seals for individual process solutions

- Added flexibility for the most demanding processes

## 1 Remote Seals Overview

The S261 seals are used in combination with 261 transmitters for gauge or absolute pressure measurements.

The seal is connected to the relevant transmitter via a capillary system that links the transmitter sensor to a "remote" seal of any type.

The S26 Series Seal System is a protective device used to isolate 2600T series transmitters from the process fluid.

The seal system provides a flexible diaphragm between the process fluid and a liquid filled capillary tube connected to the body of the transmitter. The diaphragm isolates the process fluid while the filled capillary tube hydraulically transmits the process pressure to the transmitter sensor. The remote seal capillary is corrosion-resistant with robust construction in stainless steel with spiral armor protection, and an optional PVC jacket.

For certain applications, it is necessary to use a remote seal in order to suit specific process conditions, e.g.:

- The process fluid has solids in suspension or is highly viscous and can foul impulse lines.
- The process fluid can solidify in impulse lines or the transmitter.
- The transmitter must be located in a separate area from a hazardous process fluid.
- The process temperature exceeds the recommended limits for the transmitter.
- The transmitter must be located in a separate area from the process for easier maintenance.

The S26 series is available with process connections for ASME or DIN pipe flanges. Extended diaphragm remote seals, suitable for connection to 2-, 3- or 4-inch resp. DN 50, DN 80 or DN 100 flanged tank nozzles or flanged tees, permit the seal diaphragm to be located flush with the inside of a tank or pipe. FDA approved fillings and compliance with 3-A Sanitary Standards are also available.

Fill fluids with FDA approval are defined as food fills and are Generally Recognized As Safe (GRAS) by the US Food and Drug Administration (FDA).

### 1.1 Seal system selection criteria

The application of an S26 system in direct mount or remote seal configuration to 2600T transmitters affects performance of the original device.

These effects are shown in:

- Accuracy
- Temperature effect
- Dynamic response

#### Accuracy

Accuracy is only marginally affected when seal diaphragm stiffness is relevant low compared with sensor stiffness. High stiffness of diaphragm associated with low URL might produce increased errors of linearity, hysteresis and long-term stability and has effect to the behavior of changing process- and environment conditions.

#### Temperature effect

The S26 system has an effect on temperature performance of the complete transmitter. Errors primarily affect the zero position of units. They are caused by a temperature-dependent change in volume of the fill fluids in the seal system. The change in volume must be absorbed by the seal diaphragm. Depending on the stiffness of the diaphragm, additional pressure may form in the fill fluid, resulting in a zero error.

The level of error depends on the stiffness of the seal diaphragm and the thermal expansion coefficient of the fill fluid.

#### Dynamic response

Application of S26 seal to transmitters increases the original time response. The amount of the increase depends on the number of elements and condition of the instrument as follows:

- transmitter sensor range
- fill fluid viscosity of the S26 system applied
- ambient and process temperature
- capillary length

The delay introduced by the seal may be added to the time constant of the associated transmitter.

To obtain the best application solution:

- choose the sensor code with URL closest to the application SPAN.
- select largest diameter diaphragm seal related to URL.
- keep the capillary length as short as possible
- Use fluids with as low as possible viscosity and minimal thermal expansion
- In vacuum applications, mount the transmitter primary 30 cm / 12 inches or more below the lower seal connection.

Remote seals with capillary tube

## 1.2 Ordering information

The transmitter and each seal system are each identified by a product code number. The code numbers are listed on the type plate of the transmitter, and each character stands for a special product feature. Refer to ordering information for a detailed explanation of the product code numbers.

A typical example of the product code is as follows:

Transmitter product code: 261GRR21\_L1 B2

Seal System Product Code: S261WHBEFSACS

If remote seal applications not described in this data sheet are required, custom applications are available. Please allow ABB to check the existing options in this case by providing the application as well as process and ambient temperature.

The following table shows the types of standard seals described in this data sheet.

ABB can also work with you to develop a special remote seal for applications requiring individual solutions.

Please contact your local ABB office or representative for additional information.

## 1.3 Fill fluid properties (Table A)

Fill fluids (applications)	Id	Density at 20 °C in kg/m <sup>3</sup>	Thermal expansion (x10 <sup>-4</sup> /K)	Process temperature	Pressure in kPa abs					
					20 °C (68 °F)	100 °C (212 °F)	150 °C (302 °F)	200 °C (392 °F)	250 °C (482 °F)	375 °C (707 °F)

### Important

Seals with diaphragm made of Tantalum should not be used with temperatures more than 220°C.

Seals dimensions on the following pages are in mm (inch).

Remote seals with capillary tube

## 2 S261W Model Wafer Remote Seal

The wafer remote seal is designed to be clamped between two ASME or DIN raised face flanges. The diaphragm side of the seal faces the process flange and a blind back-up flange is used on the other side of the seal.

Only gaskets manufactured from soft materials may be used with remote seals whose diaphragms and sealing surface is made of tantalum.

#### Important

Gasket and fixing accessories not supplied.

Mounting with capillary tube.

### 2.3 Technical data

#### Maximum Working Pressure

##### Flush diaphragm wafer remote seals

- Acc. to DIN from PN 10 bar to PN 400 bar
- Acc. to ASME from 150 psi to 1500 psi

##### Extended diaphragm remote seal

- Acc. to DIN from PN 10 bar to PN 100 bar
- Acc. to ASME from 150 psi to 600 psi but not higher than the load capacity of the flange (not supplied)

#### Vacuum Service

Same as fill fluid limits. Refer to table A.

#### Process Temperature Limits

Same as fill fluid limits. Refer to table A.

- 220 °C (428 °F) for tantalum diaphragm.
- 150 °C (302 °F) for use with FEP anti-stick coating.

#### S261W Wafer remote seal connected to 261GR/AR

Additional effect for each 20 K (36 °F) temperature change

### 3.2 Technical data

#### Maximum Working Pressure

DIN PN 16/PN 40: 4 MPa, 40 bar, 580 psi

DIN PN 63: 6,3 MPa, 63 bar, 913 psi

DIN PN 100: 10 MPa, 100 bar, 1450 psi

Standard temperature 50 °C (122 °F); as temperature increases the permissible pressure load capacity decreases acc. to EN 1092-1

ASME CL 150: 1,59 MPa, 15,9 bar, 230 psi

ASME CL 300: 4,14 MPa, 41,4 bar, 600 psi

ASME CL 600: 8,27 MPa, 82,7 bar, 1200 psi

Standard temperature 38 °C (100 °F); as temperature increases the permissible pressure load capacity decreases acc. to ASME B16.5

#### Vacuum Service

Same as fill fluid limits. Refer to table A.

#### Process Temperature Limits

Same as fill fluid limits. Refer to table A.

- 220 °C (428 °F) for tantalum diaphragm.
- 150 °C (302 °F) for use with FEP anti-stick coating.

#### S261F flanged remote seal, connected to 261GR/AR

Additional effect for each 20 K (36 °F) temperature change

	Size	System (sensor) error			Capillary error per meter			Seal error

Remote seals with capillary tube

---

## 5.2 Technical data

### Maximum Working Pressure

DIN-compliant from PN 6 bar to PN 100 bar (higher pressure stages on request), ASME-compliant from 150 (300) psi to 2500 psi, but not higher than the rating of the mounting flange (not supplied).

### Vacuum Service

Same as fill fluid limits. Refer to table A.

### Process Temperature Limits

Same as fill fluid limits. Refer to table A.

## 5.3 Temperature effect

The following table shows the temperature effect for a 20 K (36 °F) change, detailed separately for:

- a) the remote seal
- b) the capillary tube per meter
- c) the transmitter (in addition to the transmitter data sheet) when filling IC silicone oil and stainless steel diaphragm materials.

When using a different filling than silicone oil, the errors can be multiplied by the quotient of thermal expansion coefficient of actual filling divided by the thermal expansion coefficient of silicone oil (filling X / silicone oil). (See table "Fill fluid properties".)
